JOB MARKET **A Macro-Finance Model of Capital Reallocation and Misallocation**

PAPER *Selected Presentations: FMA Doctoral Student Consortium 2026, Economics Graduate Student Conference 2026, NSE PhD Workshop*

I quantitatively study the efficiency in capital allocation and financial markets jointly in a general equilibrium model with heterogeneous investors. Leveraged intermediaries allocate wealth across sectors that differ in productivity and risk exposure, and face state-dependent margin constraints. I find that efficiency in financial markets and allocative efficiency in capital are mutually reinforcing. Three forces drive this result. First, efficient capital allocation in the presence of sectoral dispersion requires strong financial balance sheets and efficient risk sharing, and reflects risk-adjusted costs of capital. Second, binding constraints during downturns distort risk sharing among investors and raise risk premia, setting the stage for capital misallocation. Third, the resulting inefficiency in capital composition further affects valuations and growth through risk sharing among investors in constrained states. The mechanisms thus create a feedback loop between efficiency in capital allocation and efficiency in financial markets.

WORKING **The Equity Constraint Channel of Monetary Policy** [SSRN](#)

PAPERS (with Heitor Almeida, Timothy Johnson, Sebastiao Oliveira)

Selected Presentations: EFA 2026, FIRS 2026, SFS Cavalcade 2026, WFA 2025

We use a measure of financial constraint that distinguishes between a company's emphasis on equity versus debt financing to show that equity-focused constrained firms endure larger declines in stock prices and implement deeper cuts in investments when faced with contractionary monetary policy shocks. We develop a parsimonious model in which contractionary shocks reduce investor demand for the equity of constrained firms, increasing their cost of capital. Equity-focused constrained firms reduce equity issuance and are more reluctant to run down cash holdings in response to tighter monetary policy. Our findings suggest that equity frictions are the main determinant of the transmission of monetary policy to the corporate sector.

Beliefs Heterogeneity and the Equity Term Structure [SSRN](#)

(with Hamilton Galindo Gil)

Selected Presentation: SFS Cavalcade 2025

What is the role of belief heterogeneity in shaping the equity term structure? We address this question by developing a general equilibrium model with habit formation in consumption and heterogeneity in both risk aversion and beliefs about the expected growth rate of the aggregate endowment. We demonstrate that the effects of belief heterogeneity are countercyclical: they increase equity yields during recessions and reduce them during expansions. These effects are more pronounced for short-term assets than for long-term ones. We then examine the role of diagnostic beliefs and show that the overreaction parameter raises equity yields across maturities, with particularly strong effects on short-term maturities during expansions. Our findings highlight the significant influence of belief heterogeneity in shaping the equity term structure.

Rates Up, Balances Up: Uneven Monetary Transmission in Consumer Credit Markets [SSRN](#)

(with Viraj Chordiya, Divij Kohli, Justin Mohr)

Selected Presentations: FMA 2026, Boulder Summer Conference 2026

What happens to consumer borrowing when interest rates rise? Standard intuition suggests that higher rates reduce borrowing by raising borrowing costs and tightening cash flow. We show that, over medium horizons, the opposite can occur. Using a representative panel of consumer credit records, we estimate dynamic responses of household debt to interest rate changes. A 25 basis point increase in the 1-year rate raises total consumer debt by about 2% over three years (\$1,539). These effects are highly uneven across households. Debt increases are concentrated among financially constrained borrowers, while high-credit-score consumers show little to no response. Additional evidence is consistent with an indirect channel: monetary tightening weakens labor-market income, and more exposed households respond by relying more on credit. Our results show that contractionary monetary policy can increase indebtedness among vulnerable households, highlighting an important distributional dimension of monetary transmission.

WORK IN
PROGRESS

Huggett Meets Epstein-Zin in Continuous Time [SSRN](#)

(with Hamilton Galindo Gil, Ji Huang)

We extend the Huggett model to include recursive preferences, and show that the elasticity of intertemporal substitution (EIS) plays a crucial role in shaping wealth and consumption distributions, while relative risk aversion (RRA) plays a marginal role. Our model is characterized by wealth and income heterogeneity among agents, incomplete markets, and separation between RRA and EIS, providing a baseline framework for macro-finance models in continuous time.

Macroprudential Policy, Balance Sheets, and Tail Risk [SSRN](#)

This paper quantitatively analyzes macroprudential policy in a general equilibrium model where financial intermediaries hold levered positions in productive capital, subject to Value-at-Risk (VaR) constraints. I show that tighter constraints mitigate tail risk, but simultaneously increase the overall volatility of the financial system when constraints bind. Tighter constraints reduce frequency of the crises but prolong their duration.

Transmission of Productivity Shocks: Implications from a Two-Sector Economy

I develop a two-sector general equilibrium model to study how sectoral shocks propagate through investment and capital reallocation. Differences in the persistence and nature of sectoral risks generate distinct responses of aggregate quantities and asset prices.

SEMINARS & **2026** (incl. scheduled)

CONFERENCES FMA Doctoral Student Consortium; FMA ($\times 2$); Economics Graduate Student Conference; NSE PhD and Postdoctoral Workshop; EFA*; CICF; UIUC Gies ($\times 2$); UIUC Macro*; FIRS*; SFS Cavalcade; Boulder Summer Conference on Consumer Financial Decision Making*;
